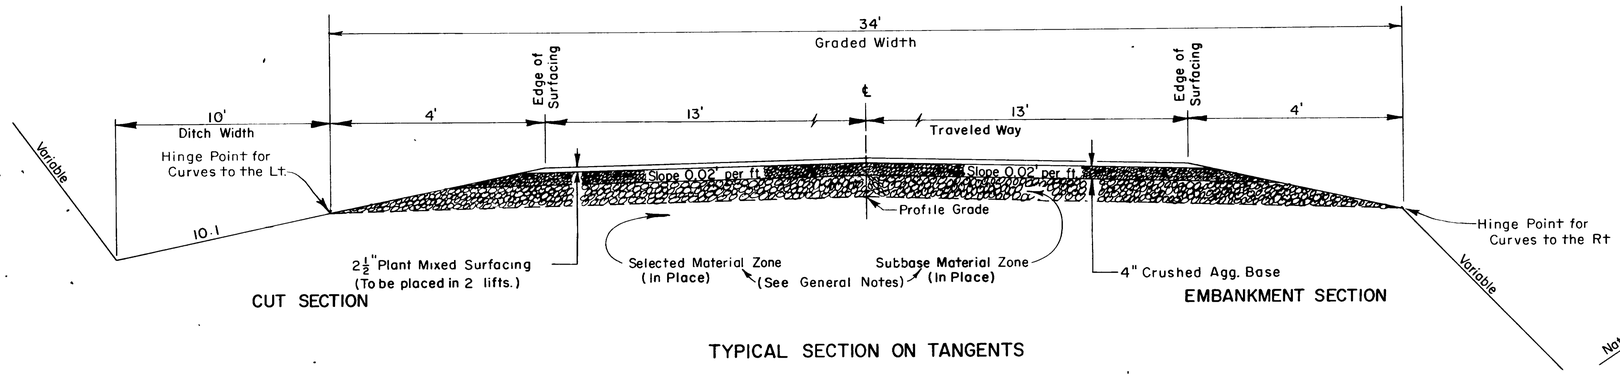
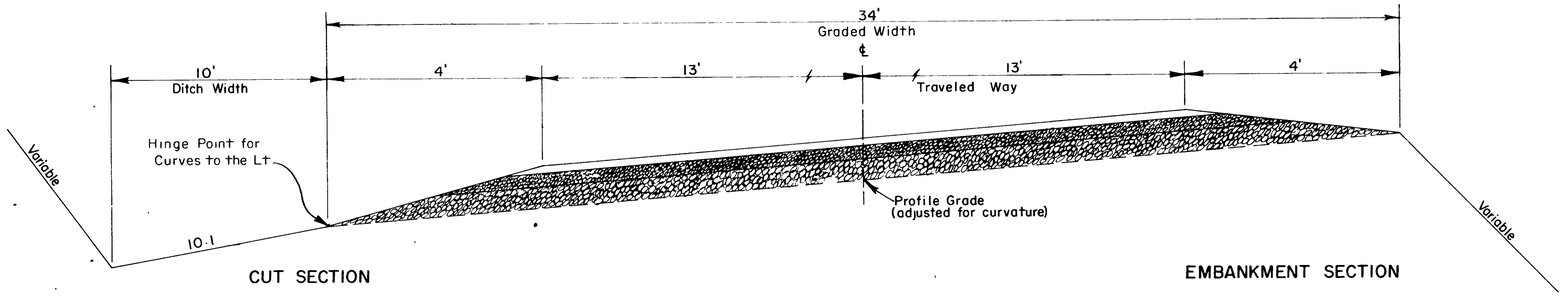
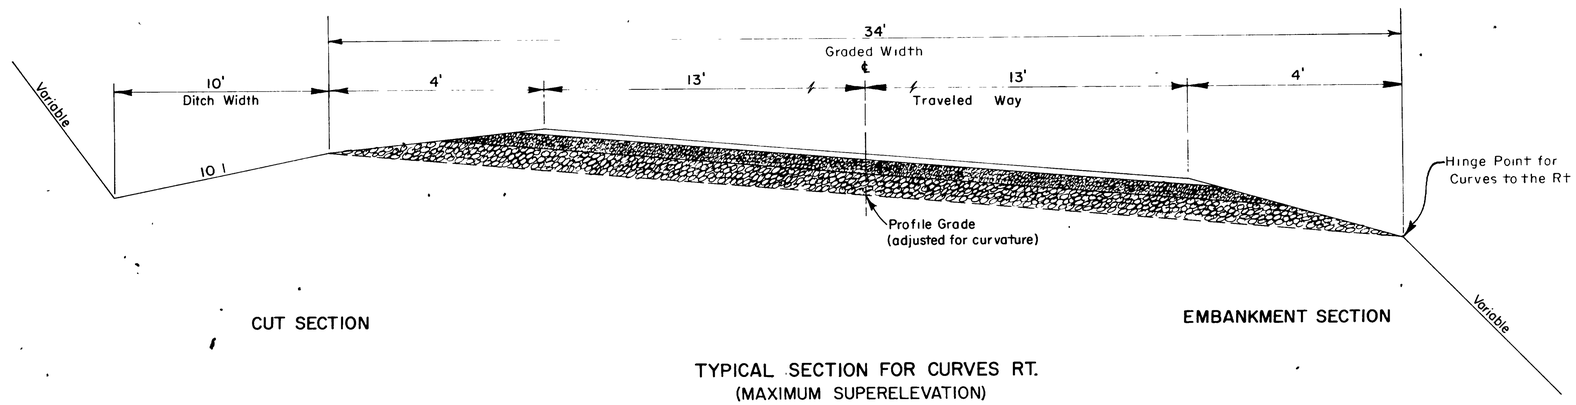
BPR REG 9, JLH 1959



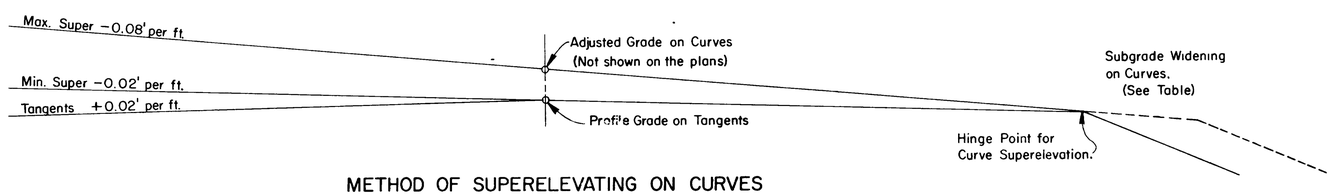
TYPICAL SECTION ON TANGENTS



TYPICAL SECTION FOR CURVES LT.
(MAXIMUM SUPERELEVATION)



TYPICAL SECTION FOR CURVES RT.
(MAXIMUM SUPERELEVATION)

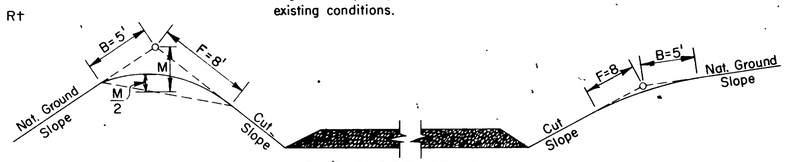


METHOD OF SUPERELEVATING ON CURVES

HEIGHT	EMBANKMENT SLOPE
0' to 3'	6:1
3' to 6'	4:1
6' to 12'	2:1
12' and up	2:1

HEIGHT	CUT SLOPE
0' to 5'	3:1
5' to 10'	2:1
10' and up	1½:1

The above tables are to be used as a guide in the design and construction of the project. The designer or field engineer may vary from these to fit existing conditions.



CUT SLOPE ROUNDING

When the cut slope is less than 8', reduce B & F distance to the actual slope distance.

Slope Rounding shall be considered as a subsidiary part of the work required in dressing the cut slopes and no allowance will be made for materials moved.

Rounding, Warping, and Finishing slopes shall be as provided in Standard Specifications and/or Special Provisions.

STABILIZING MATERIALS

STATION TO STATION		Subbase Material Zone		Selected Material Zone	
		Item	Depth	Item	Depth
449+00	659+00	104(2)	6"	104(2)	3"

GENERAL NOTES

The Typical Section and the table above show a "Selected Material Zone" and a "Subbase Material Zone" These terms are for defining locations and depths of materials only, and are not to be considered as pay items having similar names. The "Selected Material Zone" lies below the profile grade (adjusted for curvature where appropriate). The "Subbase Material Zone" lies above the profile grade and just below the base course zone.

Where the plans show special material to be placed in the "Selected Material Zone," the roadway excavations and embankments shall be constructed to the grade that will allow for the required thickness The thicknesses of materials shown in the above table are based on laboratory analysis of samples taken at random along the proposed construction. During construction, the engineer will adjust the thicknesses as necessary to insure adequate structural stability, including the placing of Section 104 materials in the "Selected Material Zone", and the placing of Section 102 materials in the "Subbase Material Zone." Section 102 materials will not be placed on top of Section 104 materials.

On grades of 3% or less, where wet or unstable conditions exist, the engineer may increase the ditch width 3 feet or more.

Any subsurface data represented on these plans is limited to the specific locations shown and those locations alone.

CURVE WIDENING*

Degree of Curve	Pavement Width		
	20'	22'	24'
5°–10°	2'	—	—
11°–21°	3'	2'	—
22° & Up	4'	3'	2'

* Widen Subgrade, Base and Surfacing.

DESIGNED L.F.K. 4-1963
DRAWN J.R.C. 4-1963

Revisions 7/1963, 5/1964

7+00	32+00	12"	
32+00	97+00	9"	
97+50	122+50	6"	
122+50	200+84	9"	
200+84	499+00	9"	

GENERAL NOTES

Where Borrow is specified in the contract and satisfactory material is found in the roadway excavation, the right is reserved to increase the amount of Unclassified Excavation and reduce the Borrow Excavation When additional material is needed for completing embankments, stabilizing the subgrade, or for selected cushion or topping, it may be secured by uniformly widening thru or sidehill cuts or flattening cut slopes where satisfactory material is available. The slopes at the ends of all cuts shall be flattened and flared to improve appearance.

Furrow ditches shall be constructed on approximate one percent grades following the ground contour and when possible shall be so constructed that the direction of flow will be away from the roadway

Topsoil shall be conserved and either placed in stockpiles or spread over cut and embankment slopes as directed and in accordance with the specifications.

Roadway ditches at the ends of cuts shall be constructed so as to carry the flow away from the adjacent embankment slopes.

Embankment slopes shall be uniformly warped between one rate of slope and another. The transition shall cover a distance of not less than fifty feet.

The grade line shown on the plan and profile sheets is centerline grade, not corrected for curvature.

Curves are superelevated and widened in accordance with AASHO standards.

SOILS DATA

Any materials soils data shown on these plans are based on tests of samples obtained from the locations and depths shown, and are only for informational purposes. They do not reflect classification of the excavation. No responsibility is assumed by the Government as to the extent of materials represented by these tests. Any assumption by the contractor as to the extent of the materials represented by these samples is strictly his responsibility. The contractor must satisfy himself as to the nature of materials to be encountered by personal inspection of the project on the ground. If materials not conforming to the data show on these plans are encountered during construction, the grading plan will be modified where necessary to insure proper design.

Project:

Stations: 0+03.10 to 200+84 (Section 2-A)
200+84 to 449+00 (Section 2-B)
449+00 to 659+00 (Section 2-2(1))

Length: 12.549 Miles

Width:
Bituminous Surfacing:
24 feet - (Sta 0+03.10 to 449+00)
26 feet - (Sta 449+00 to 659+00)

Crushed Aggregate Base, Grading E:
Sta 0+03 to 449+00 - Intermediate repair Sections, Length Variable, depth variable, width 26 feet.
Sta 449+00 to 659+00 - Length 4.037 mi., width 27.5 feet, depth 4 inches.
Weight 151 lbs. per cu. ft.

Emulsified Asphalt, Grade SS-1, Tack Coat, 0.06 gal per sq. yd.

Asphalt, grade MC-0 or MC-1, Prime Coat, 0.30 gal per sq. yd.

Asphalt Cement, 120-150 penetration, 6.0 percent by weight, with 1 percent heat stable additive, equivalent to Acra 300.

Plant Mixture.
Sta 0+03.10 to 449+00, depth 2 inches, plus intermediate leveling courses
Sta 449+00 to 659+00, depth 2.5 inches
Wt. 153 lbs per cu. ft.

Emulsified Asphalt, Grade SS-1, Seal Coat, 0.075 gal per sq. yd.

Type Code: 4241 Sta 449+00 to 659+00
4242 Sta 0+03.10 to 449+00

Not included in this contract

GENERAL NOTES

Where Borrow is specified in the contract and satisfactory material is found in the roadway excavation, the right is reserved to increase the amount of Unclassified Excavation and reduce the Borrow Excavation. When additional material is needed for completing embankments, stabilizing the subgrade, or for selected cushion or topping, it may be secured by uniformly widening thru or sidehill cuts or flattening cut slopes where satisfactory material is available. The slopes at the ends of all cuts shall be flattened and flared to improve appearance.

Furrow ditches shall be constructed on approximate one percent grades following the ground contour and when possible shall be so constructed that the direction of flow will be away from the roadway.

Topsoil shall be conserved and either placed in stockpiles or spread over cut and embankment slopes as directed and in accordance with the specifications.

Roadway ditches at the ends of cuts shall be constructed so as to carry the flow away from the adjacent embankment slopes.

Embankment slopes shall be uniformly warped between one rate of slope and another. The transition shall cover a distance of not less than fifty feet.

Subgrade grade to be on the surface of stabilized graded road and located ten feet from center line on tangents and insides of curves.

Bureau of Public Roads book of, "Transition Curves for Highways," shall be used to determine superelevation and transition lengths (Table I), and widening of curves (Table II).

SOILS DATA

The materials soils data shown on these plans are based on tests of samples obtained from the locations and depths shown, and are only for informational purposes. They do not reflect classification of the excavation. No responsibility is assumed by the Government as to the extent of materials represented by these tests. Any assumption by the contractor as to the extent of the materials represented by these samples is strictly his responsibility. The contractor must satisfy himself as to the nature of materials to be encountered by personal inspection of the project on the ground. If materials not conforming to the data show on these plans are encountered during construction, the grading plan will be modified where necessary to insure proper design.

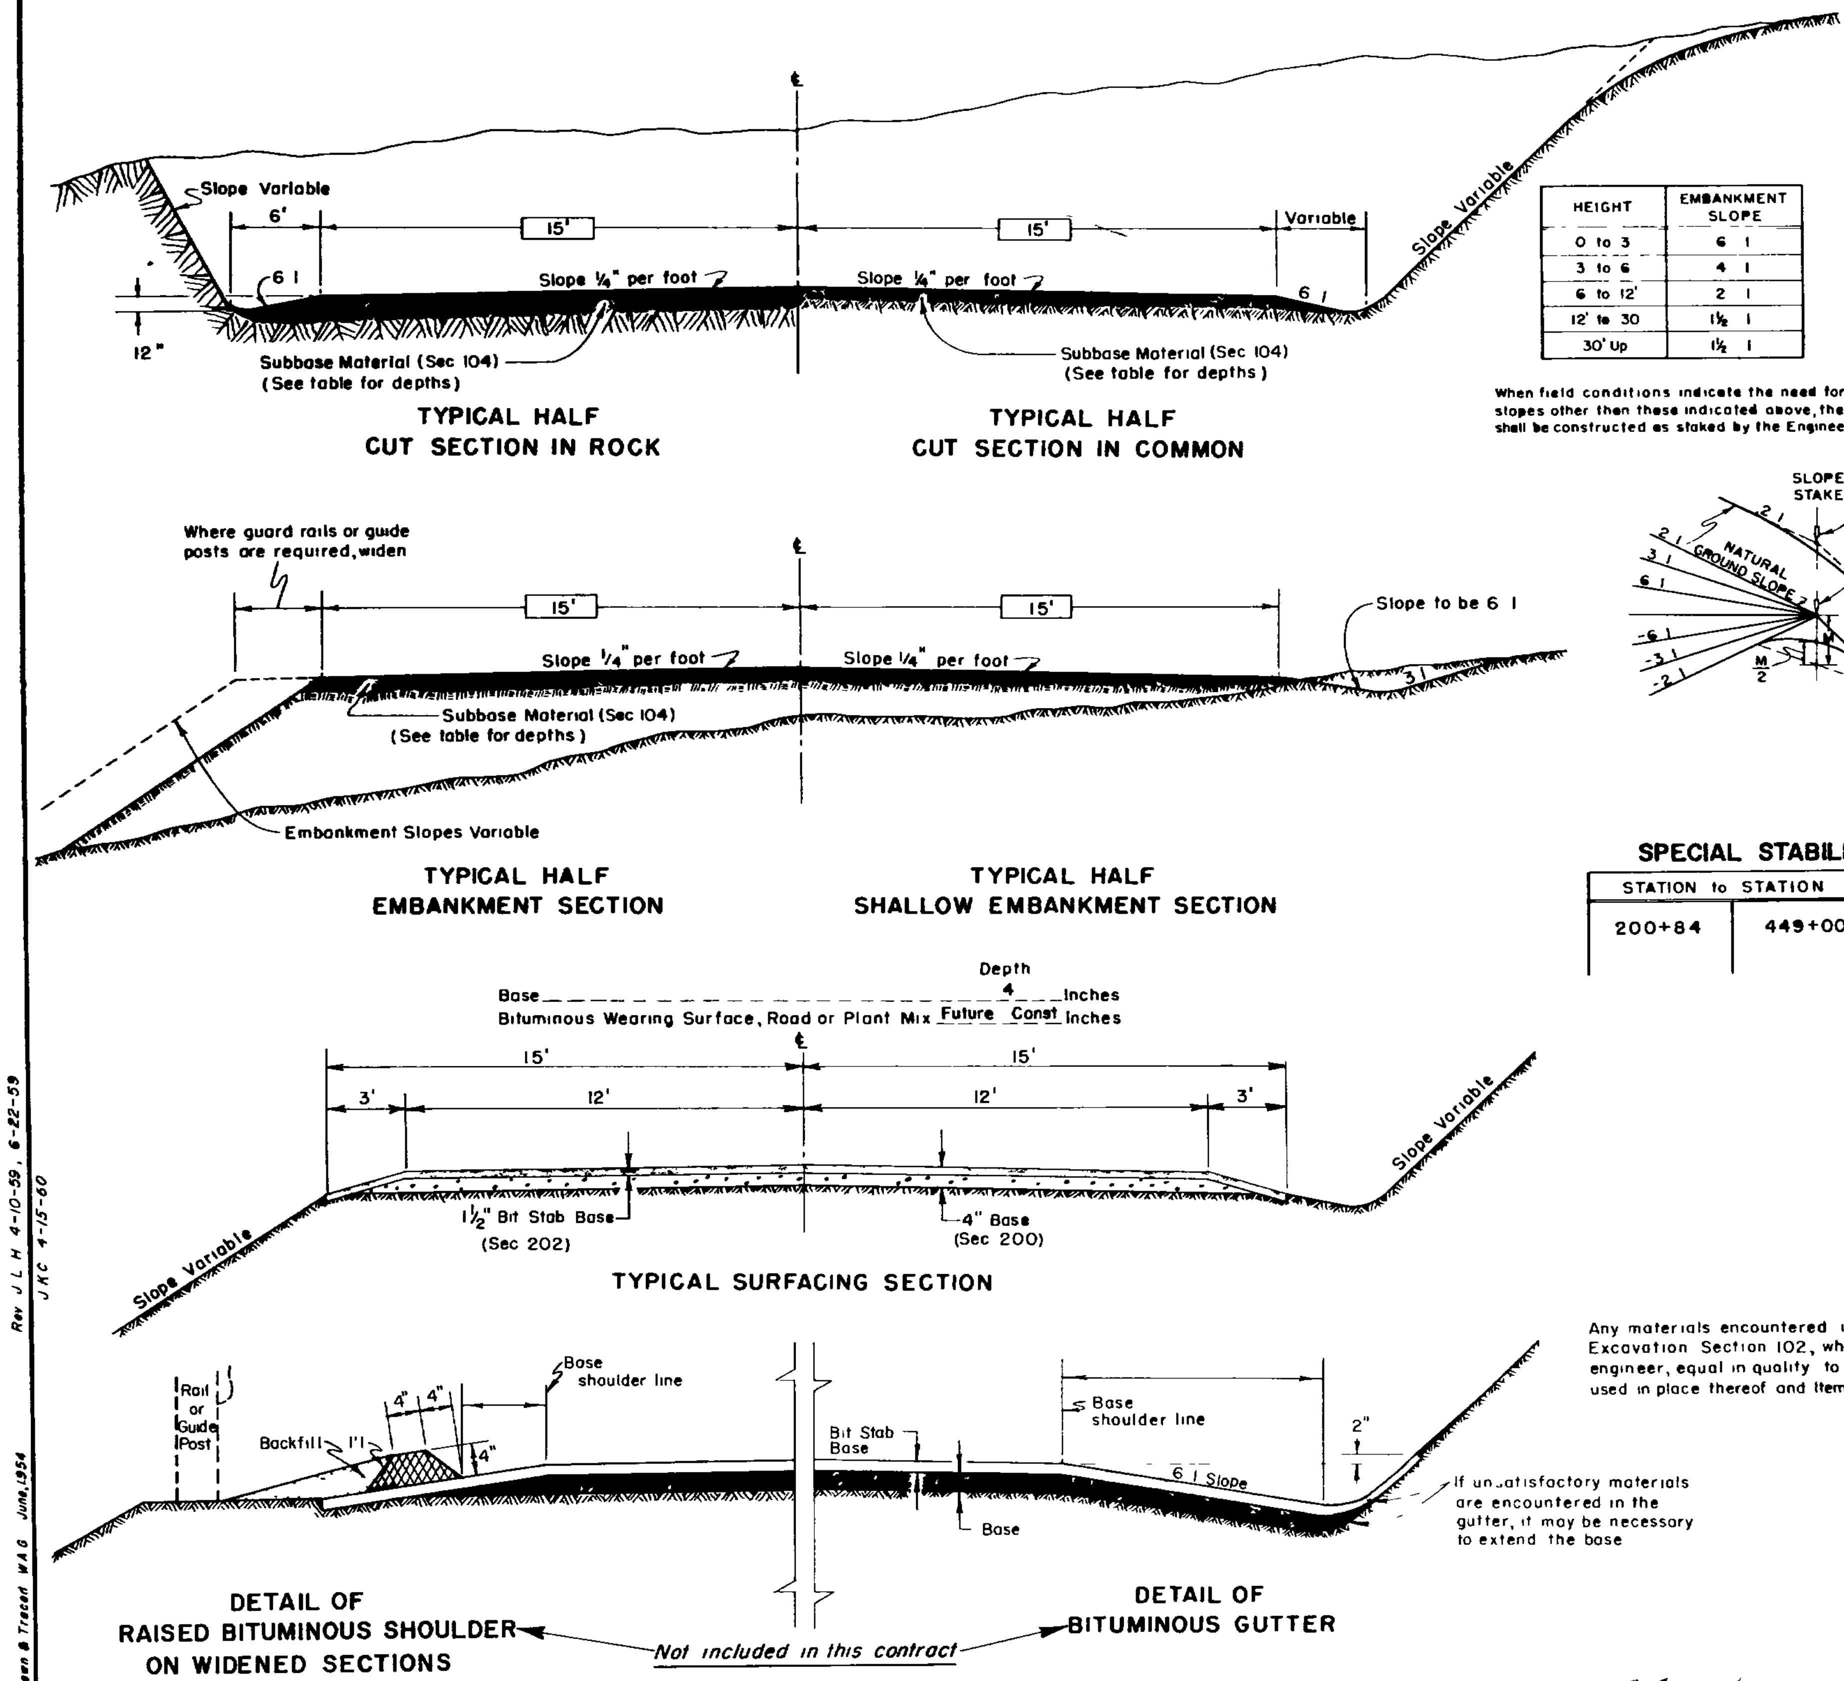
_____ DATE _____ 19__
REGIONAL ENGINEER



HEIGHT	EMBANKMENT SLOPE
0 to 3	6 1
3 to 6	4 1
6 to 12'	2 1
12' to 30	1½ 1
30' Up	1½ 1

When field conditions indicate the need for slopes other than these indicated above, they shall be constructed as staked by the Engineer

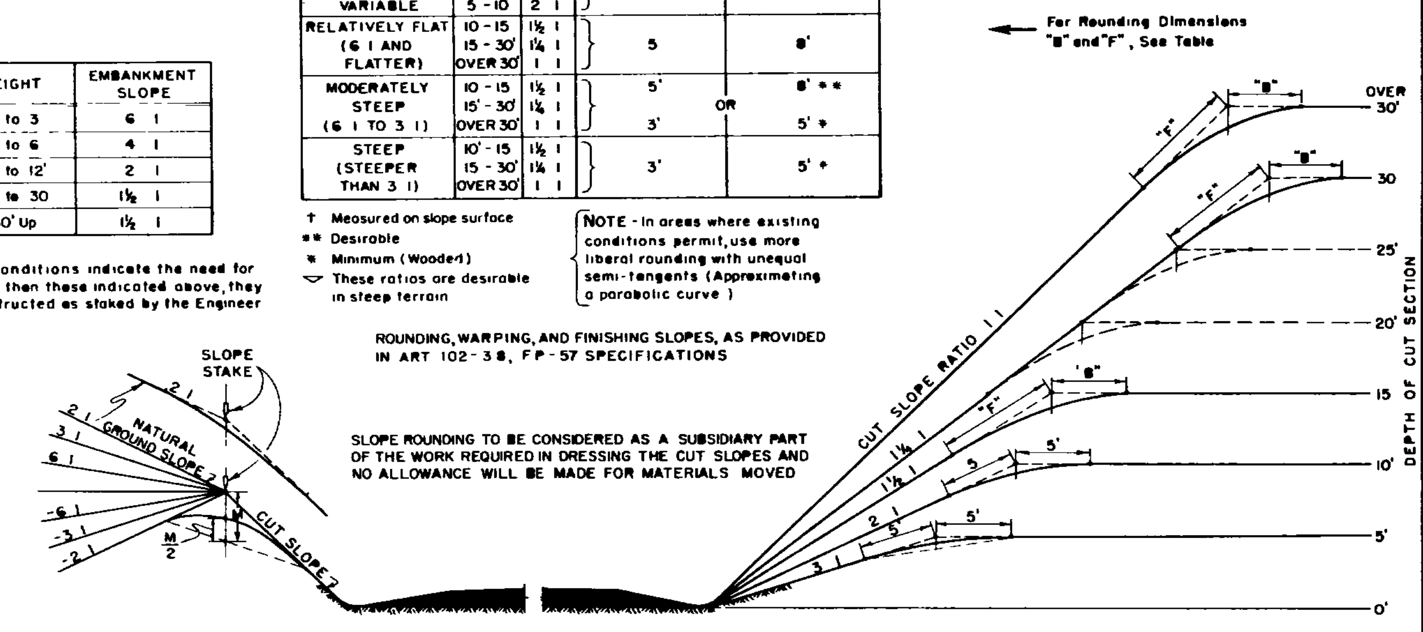
SLOPE ROUNDING FACTORS			ALTERNATE ROUNDING DIMENSIONS	
NATURAL GROUND SLOPE	CUT SLOPE HEIGHT	CUT SLOPE RATIO ▽	SEMI-TANGENTS † Back of Slope Stake "B"	SEMI-TANGENTS † Front of Slope Stake "F"
VARIABLE VARIABLE	0'-5' 5-10	3 1 2 1	5'	5'
RELATIVELY FLAT (6 1 AND FLATTER)	10-15 15-30' OVER 30'	1½ 1 1¼ 1 1 1	5	8'
MODERATELY STEEP (6 1 TO 3 1)	10-15 15'-30' OVER 30'	1½ 1 1¼ 1 1 1	5' OR 3'	8' ** OR 5' *
STEEP (STEEPER THAN 3 1)	10'-15 15-30' OVER 30'	1½ 1 1¼ 1 1 1	3'	5' *

† Measured on slope surface
** Desirable
* Minimum (Wooded)
▽ These ratios are desirable in steep terrain

NOTE - In areas where existing conditions permit, use more liberal rounding with unequal semi-tangents (Approximating a parabolic curve)

ROUNDING, WARPING, AND FINISHING SLOPES, AS PROVIDED IN ART 102-3 8, FP-57 SPECIFICATIONS

SLOPE ROUNDING TO BE CONSIDERED AS A SUBSIDIARY PART OF THE WORK REQUIRED IN DRESSING THE CUT SLOPES AND NO ALLOWANCE WILL BE MADE FOR MATERIALS MOVED



CUT SLOPE ROUNDING

SPECIAL STABILIZING MATERIAL

STATION to STATION		SUBBASE Item 104(2)	SELECTED BORROW Item 102( )
200+84	449+00	9"	

Any materials encountered in the Roadway and Borrow Excavation Section 102, which are in the opinion of the engineer, equal in quality to the above Item 104(2) shall be used in place thereof and Item 104(2) reduced accordingly

GENERAL NOTES

Where Borrow is specified in the contract and satisfactory material is found in the roadway excavation, the right is reserved to increase the amount of Unclassified Excavation and reduce the Borrow Excavation When additional material is needed for completing embankments, stabilizing the subgrade, or for selected cushion or topping, it may be secured by uniformly widening thru or sidehill cuts or flattening cut slopes where satisfactory material is available The slopes at the ends of all cuts shall be flattened and flared to improve appearance.

Furrow ditches shall be constructed on approximate one percent grades following the ground contour and when possible shall be so constructed that the direction of flow will be away from the roadway

Topsoil shall be conserved and either placed in stockpiles or spread over cut and embankment slopes as directed and in accordance with the specifications

Roadway ditches at the ends of cuts shall be constructed so as to carry the flow away from the adjacent embankment slopes

Embankment slopes shall be uniformly warped between one rate of slope and another The transition shall cover a distance of not less than fifty feet

Subgrade grade to be on the surface of stabilized graded road and located on center line on tangents

Bureau of Public Roads book of, "Transition Curves for Highways", shall be used to determine superelevation and transition lengths (Table I), and widening of curves (Table IX)

SOILS DATA

The materials soils data shown on these plans are based on tests of samples obtained from the locations and depths shown, and are only for informational purposes They do not reflect classification of the excavation No responsibility is assumed by the Government as to the extent of materials represented by these tests Any assumption by the contractor as to the extent of the materials represented by these samples is strictly his responsibility The contractor must satisfy himself as to the nature of materials to be encountered by personal inspection of the project on the ground If materials not conforming to the data shown on these plans are encountered during construction, the grading plan will be modified where necessary to insure proper design

Computations written in columns:

- 102(1) Overbreak and Slides: 1,000 Cu. Yd. Estimated
- 102(9) Furrow Ditches: Est. 1000' per mile = 4,700
- 104(2) Special Subbase: 27,394 X 27 X 135# / 2000 = 49,926 Ton
- 108(1) Water: Embankment: 234,905 X 0.020 = 4,698; Subbase: 49,926 X 0.030 = 1,498; Base: 16,549 X 2% = 310; Traffic Maintenance (Est.) 594; = 7,100
- 109(1) Rolling: Embankment: 234,905 ÷ 200 = 1,175; Subbase: 27,394 ÷ 125 = 219; = 1,394 Hrs.
- 200(4) Crushed Aggregate Base: 245,169 X 135# / 2,000 = 16,549 Tons
- 202(1) Processing: 90,000 Sq. Yd.
- 202(2) Asphalt: Prime: 90,000 X 0.30 / 245 = 110.2; Mix: 810,000 X 1.5 X 135 X 0.04 / 12 X 2000 = 273.4; = 383.6 Ton
- 202(3) Emulsified Asphalt: 90,000 X 0.10 / 245 = 36.7 Ton
- 203(1) Bituminous Additive: Mix: 274 X .02 = 5.48 Ton

Note Design of end-section shall conform to Standard Reinforced Sectional Concrete Culvert Pipe

GENERAL NOTES

Concrete All concrete to be Class "A", made with Type II (Low Alkali) Portland Cement, with an air-entraining admixture Concrete to be poured monolithically All exposed edges shall be chamfered 1" All exposed surfaces to be given a "Rubbed Finish"

*Reinforcing Steel To be ½" round bars, and placed as shown in drawings Dimensions are to the center of bar

Foundations If foundation materials under headwalls are found unsuitable, either remove and replace with satisfactory selected material, or extend the concrete to provide a satisfactory footing

Construction Methods The minimum earth cover on top of the pipe shall not be less than ½ D, with a minimum cover of one foot Headwalls in all cases to be built parallel to the center line of the road

*Payment for reinforcing steel to be included in price bid for concrete

NOTES -

The center line shall be monumented at mile and half-mile intervals or intersections of public land lines, and at two points on the terminal courses including initial point and end of survey

On all projects not located on Government land right-of way boundaries shall be permanently marked with brass capped pipes on which the point number the route, and the section of project are stamped These should be set at terminal points of survey, on all public land lines crossing ℄ of survey, and at other points necessary to define right of-way boundaries When placed on curves they shall be located on radial lines, except when on public land lines.

Permanent bench marks shall be set at intervals of approximately one mile They shall be set on conspicuous permanent objects such as top of wing wall of bridge abutments, headwalls, suitable rock surfaces, or a brass capped pipe marker may be set in ground

All markers shall be accurately located with reference to the center line and an accurate record made of distances and angles to the various points, which shall be shown on the "As Constructed" plans

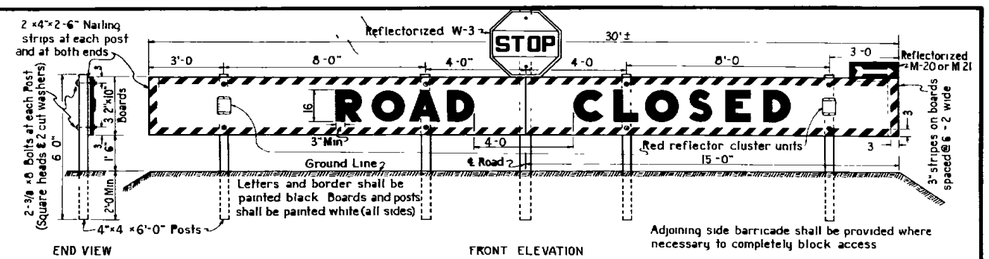
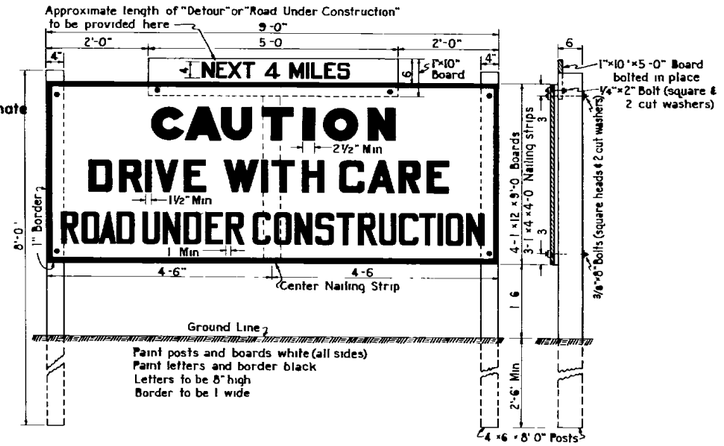
TYPICAL SIGN LAYOUT FOR DETOUR



SIGN 'C'

Signs of similar wording and approximate size as "A" and "B" meeting state specifications may be used.



SIGN 'A'

NOTE This sign is the same size and of the same construction as sign A shown above, and requires the same supports

Paint posts and boards white (all sides)
Paint letters and border black

SIGN 'B'

STANDARD SIGNS

DESIGN (From "Manual and Specifications for U S Standard Road Markers and Signs)
This set of designs is based on definite principles calculated to produce uniformity of significance in the signs themselves, and make familiarity with them easy to acquire on the part of the most casual driver These principles are a set of shapes each having its own significance, a set of color combinations, each having its own significance, a few obvious symbols and uniformity of erection and application
Standard Signs not shown are, C-8 (Fresh Oil), C-13 (Loose Gravel), C-17 (Begin Detour 400 Ft), and C-18 (End Detour 400 Ft) These signs are from "Manual and Specifications for U S Standard Road Markers and Signs"

SHAPE
The Octagonal sign is used to indicate "Stop" The Diamond shaped signs, commonly called "Slow" signs, are used to indicate any condition inherent in the road itself requiring slow speed and caution on the part of the driver The Square shaped signs, commonly called "Caution" signs are used to indicate any condition requiring caution that is not inherent in the road itself, but which is due to contiguous or adjacent conditions which often are also intermittent Rectangular signs of various dimensions are used to carry directions information and restrictions of use or benifit to the driver

COLOR
All standard signs of a precautionary character, including the octagonal stop sign, the diamond slow sign, and the square caution sign have black designs on a yellow background
All direction, information and restriction signs are black on a white background

SPECIAL SIGNS SIGNS-A- B & C

MATERIAL
First grade lumber, reasonably free from knots and other defects shall be used All dimensions shall be in accordance with working drawings

FABRICATION
These signs shall be securely nailed and bolted to withstand high wind pressures Bolts shall be used where shown on working drawings The finished sign shall be free from all defects and made in a neat and workman like manner

FINISH
These signs shall have black letters on a white background The number of coats and quality of paint used shall be sufficient to give a neat and finished sign that will withstand weather without cracking or peeling
The back of the sign shall be painted white

GENERAL NOTES

ERECTION AND DISPLAY OF SIGNS
The signs are to be erected for the purpose of directing traffic over a specific route and shall be so located as to be conspicuously visible day and night They shall be set facing, and on the right hand side of approaching traffic They shall be so located that they will be seen at all times by approaching traffic with the minimum of effort
Signs shall be fastened with 2-3/8 carriage bolts to substantial posts when they are necessary for an extended period Portable supports, such as tripods are permitted for short periods, provided the construction is such that wind or other agents can not readily upset the sign
All signs required shall be furnished installed, and maintained in good order by the contractor Payment will not be direct but will be considered included in the price bid for the regular construction items

USE
Sign C-5 shall be used separately or in conjunction with other signs, (C-5 slow sign to precede by at least 100') whenever the condition of the road requires a reduction of speed
Signs M-20 and M 21 shall be erected at the beginning of detour at intervals of ¼ mile, and at junctions with other roads, also when necessary shall be attached to sign C
Sign W-3 shall be erected from 25 to 50 feet in advance of the point where a full stop is required, and shall be preceded at approximately 500 feet by a slow sign
Sign C shall be erected where it is necessary to completely block access to the new construction Under special conditions, where local traffic must pass through barrier, special provision may be made to provide restricted access by gate This sign shall be preceded by the cautionary signsshown in the above sketch

LIGHTS
Lights shall be kept burning from sunset to sunrise at all points considered dangerous In general the lights shall be torch bombs unless there is a danger from fire, when lanterns shall be substituted
Some specific points where lights must be placed
1 At the end of the section where work is under way, placed so as to illuminate the warning signs
2 At all points where particular caution is required, as at turns or sharp curves, temporary bridge approaches, and sudden or large grade changes, placed so as to illuminate the corresponding signs
3 Sign C shall be furnished with 2 red reflector cluster units, each unit having a minimum of 15 red reflector buttons, each of a diameter not less than 5/8 inch These units shall be securely fastened on the sign in locations as shown in the sketch In addition to these reflectors a minimum of five torch bombs or similiar lights shall be placed in front of the barrier

GENERAL
Selection and placement of signsshall be subject to approval of the engineer Where signs other than those on the plans are required, they shall conform to the standards for the same class of signs as shown on the plans The use of special signs shall be limited Upon opening the work to the public, all construction signs must be removed immediately, so that there will be no confusion

*When pipes of 30-, 36-, and 42-inch diameters are placed under fills as indicated above, the pipes shall be factory-formed to produce a 5 percent elongation of the vertical axis.

GENERAL NOTES

The gages indicated above the dashed line in Tables 2 and 3 are gages supported by Specifications FP-57. The gages below and to right of the dashed line are in excess of Specifications FP-57 and, when used, will require payment based on the heavier gage.

All full-circle corrugated metal culvert pipe of 48- to 84-inch diameters shall be factory-formed to produce a 5 percent elongation of the vertical axis. Where such pipes are placed under embankments up to 30 feet in depth, no strutting will be required. Where such pipes are placed under embankments in excess of 30 feet, strutting will be required as shown.

These tables are supplemental to Specification Items 453 and 454 of FP-57.

Table 4.-----Spacing and Size of Timber Struts

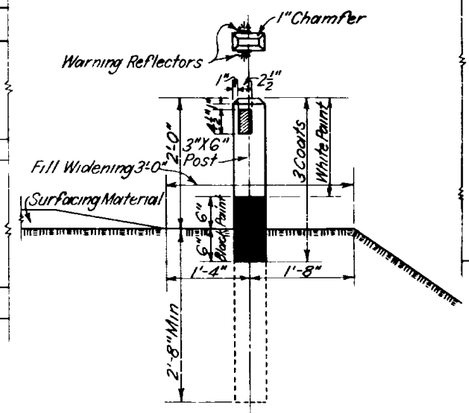
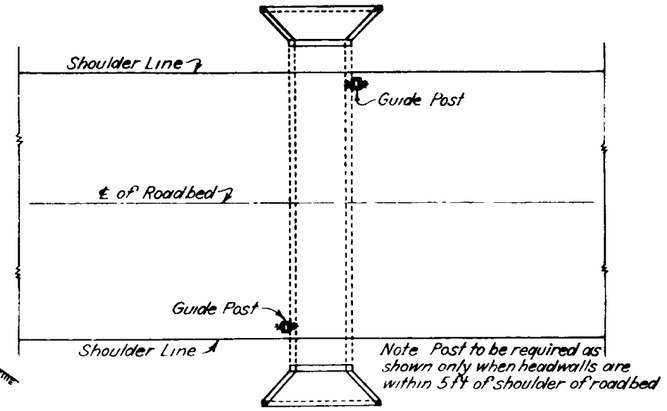
PLAN

PLACEMENT AT BRIDGE APPROACHES

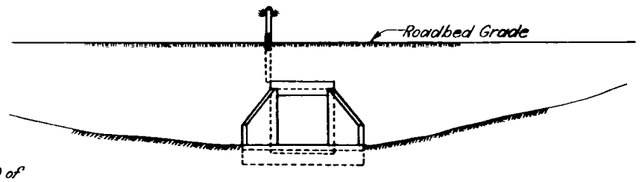


POST DETAIL

SCALE 1" = 1'-0"

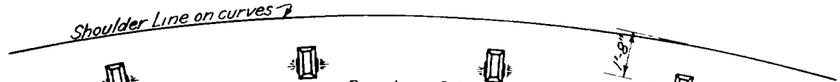


PLAN



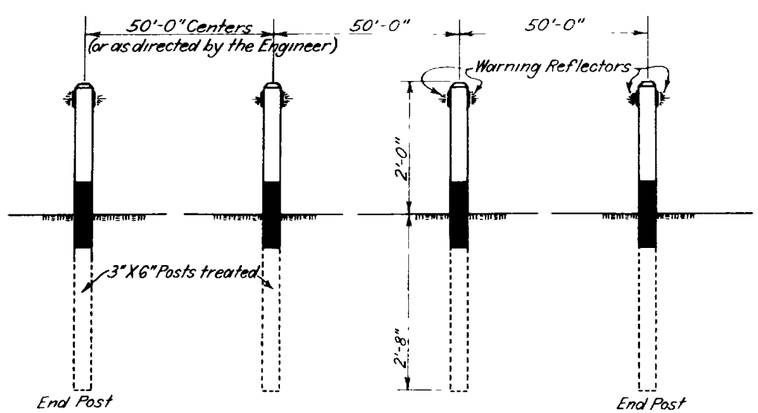
ELEVATION

PLACEMENT AT MINOR STRUCTURES



PLAN FOR HORIZONTAL CURVES

PLAN FOR TANGENTS



ELEVATION

PLACEMENT ON TANGENTS AND HORIZONTAL CURVES

Materials All posts shall be Coast Region Douglas Fir Select Structural Grade 1400# f West Coast Lumberman's Ass'n Grading Rule 12, 1943

Treatment All posts shall be treated as provided under Item 430 of Specifications FP-57 The following preservatives may be used with a minimum absorption as given per cubic foot of wood - Chromated zinc chloride 1.15 pounds, Chromated zinc arsenate 1 pound, Osmosalts 3.5 pounds; Wolman salts 3.5 pounds

Timber shall not be incised

Reflector Units Reflector Units shall be the reflecting panel type mounted on 20 gauge galvanized sheets The reflecting panel shall be silver "Scotchlite" as manufactured by the Minnesota Mining and Manufacturing Co of St Paul, Minnesota or an acceptable equivalent

Construction Methods Reflector Units on all posts shall be placed in such position that the units will function at a distance of 500 feet A test shall be made to assure the position of the Reflector Units to be the most effective possible

The Engineer will determine the spacing and location of the Timber Guide Posts with reference to the curvature and height of fill

The Reflector Panels shall be fastened to the posts with two 8d galvanized barbed nails on both sides of the posts

Painting Posts shall be painted two coats before erecting and a third or final coat after erecting as shown and in accordance with the specifications for Item 430 - Treated and Untreated Timber of Specifications FP-57

GENERAL NOTES

Specifications Public Roads Administration, Form FP 41 - Supplement 8-1-45

Concrete All to be Class "A" with Portland Cement, Type II (Low Alkali) with an Air-Entraining Admixture Concrete to be poured monolithically All exposed edges and corners shall be chamfered 1" All Exposed surfaces to be given a "Rubbed Finish"

*Reinforcing Steel To be ½" round bars, placed 3" from surface of concrete Dimensions are to the center of bar

Foundations If foundation materials under headwalls are found unsuitable, either remove and replace with satisfactory selected material, or extend the concrete to provide a satisfactory footing

Construction Methods The minimum earth cover on top of the pipe shall not be less than ½ D or ½ D_2 (vertical diameter of the pipe) with a minimum cover of one foot Headwalls in all cases to be built parallel to the center line of the road

*Payment for reinforcing steel to be included in the price bid for concrete
